# Chapter- 1: Introduction

A compiler is a computer program that helps in translating the computer code from one programming language into another language. Basically, it translates the program written in the source language to the machine language. The compiling process contains an essential translation operation and error detection.

In **Compiler Design and Construction Lab** we learnt about Lex, Yacc, VI editor and designed different types of lexical analyzer and parser. Lex is a program that generates lexical analyzer. It is used with Yacc parser generator. The lexical analyzer is a program that transforms an input stream into a sequence of tokens. It reads the input stream and produces the source code as output through implementing the lexical analyzer in the C program. Yacc is a computer program for the UNIX operating system developed by Stephen C. Johnson. It is a Look Ahead Left-to-Right Rightmost Derivation parser generator, generating a LALR parser based on a formal grammar, written in a notation similar to Backus–Naur Form. VI is a screen-oriented text editor originally created for the UNIX operating system. The portable subset of the behavior of VI and programs based on it, and the ex-editor language supported within these programs, is described by the Single UNIX Specification and POSIX.

This report represents basic commands about VI editor, alternatives of VI editor, difference between Lex and Yacc and some mini-project using Lex and Yacc that we learnt from our lab class(es).

## 1.1 VI Editor Commands

- ✓ \$ vi filename — Open or edit a file.
- ✓ \$ vi -R filename - Opens an existing file in read only mode.
- ✓ i — Switch to Insert mode.
- ✓ Esc — Switch to Command mode.
- ✓ :w — Save and continue editing.
- ✓ :wq or ZZ — Save and quit/exit vi.
- ✓ :q! — Quit vi and do not save changes.
- ✓ j — Move down one line.
- ✓ k — Move up one line.
- ✓ 0 or | - Positions cursor at beginning of line.
- ✓ \$ - Positions cursor at end of line.
- ✓ W - Positions cursor to the next word.
- ✓ B - Positions cursor to previous word.
- ✓ ( - Positions cursor to beginning of current sentence.
- ✓ ) - Positions cursor to beginning of next sentence.
- ✓ H - Move to top of screen.
- ✓ M - Move to middle of screen.
- ✓ L - Move to bottom of screen.
- ✓ r - Replace single character under the cursor with the next character typed.
- ✓ R - Replaces text from the cursor to right.
- ✓ s - Replaces single character under the cursor with any number of characters.
- ✓ S - Replaces entire line.

- ✓ X Uppercase - Deletes the character before the cursor location.
- ✓ x Lowercase - Deletes the character at the cursor location.
- ✓ Dw - Deletes from the current cursor location to the next word.
- ✓ d^ - Deletes from current cursor position to the beginning of the line.
- ✓ d\$ - Deletes from current cursor position to the end of the line.
- ✓ Dd - Deletes the line the cursor is on.
- ✓ Yy - Copies the current line.
- ✓ p - Puts the copied text after the cursor.
- ✓ h — Move left one character.
- ✓ l — Move right one character.
- ✓ A — Append to the end of the line.
- ✓ I — Append text at the beginning of the current line.
- ✓ a — Append after the cursor's current position.
- ✓ b — Go to the beginning of the word.
- ✓ e — Go to the end of the word.
- ✓ o — Open a new line under the current line.
- ✓ O — Open a new line above the current line.
- ✓ x — Delete a single character.
- ✓ dd — Delete an entire line.
- ✓ Xdd — Delete X number of lines.
- ✓ G — Go to the last line in a file.
- ✓ XG — Go to line X in a file.
- ✓ gg — Go to the first line in a file.
- ✓ :num — Display the current line's line number.

## 1.2 Alternatives of VI Editor

Traditional Ex - VI editor alternatives are mainly Text Editors but may also be Code Editors or IDEs. Some of them are Visual Studio Code, Notepad++, Atom, VSCodium, Kate, Gearnny, GNU nano, gedit, etc. Among them:

### 1. Visual Studio (VS) Code:

#### ➤ Advantages:

- ❖ Extensible by Plugins/Extensions
- ❖ Lightweight
- ❖ Auto-completion
- ❖ Syntax Highlighting
- ❖ Git Support
- ❖ Support for Themes
- ❖ Dark Mode
- ❖ Support for Mark-Down
- ❖ No registration required

➤ **Disadvantages:**

- ❖ Some settings are not very easy to toggle.
- ❖ For some extensions also the settings are not as easy as they require configuration file changes which might be difficult for beginner users.
- ❖ Sometimes the name 'Visual Studio Code' confuses people with Microsoft's IDE 'Microsoft Visual Studio'.

## 2. Notepad++:

➤ **Advantages:**

- ❖ Lightweight
- ❖ Code Formatting
- ❖ Portable
- ❖ Extensible by Plugins/Extensions
- ❖ Auto-completion
- ❖ Syntax Highlighting
- ❖ Live Preview

➤ **Disadvantages:**

- ❖ It is difficult for newbies who make mistakes often as there are not many external aids when writing code.
- ❖ The interface is not convincing, the code that is written often is not very visible and very confusing at first sight.
- ❖ The most disadvantage of Notepad++ is that it is not multiplatform.

## 1.3 Differences between Lex and Yacc

Lex	Yacc
Computer program that operates as a lexical analyzer	Parser that is used in Unix Operating System
Developed by Mike Lex and Eric Schmidt	Developed by Stephan C. Johnson
Reads the source program one character at a time and converts it into meaningful tokens	Takes the tokens as input and generates a parse tree as output

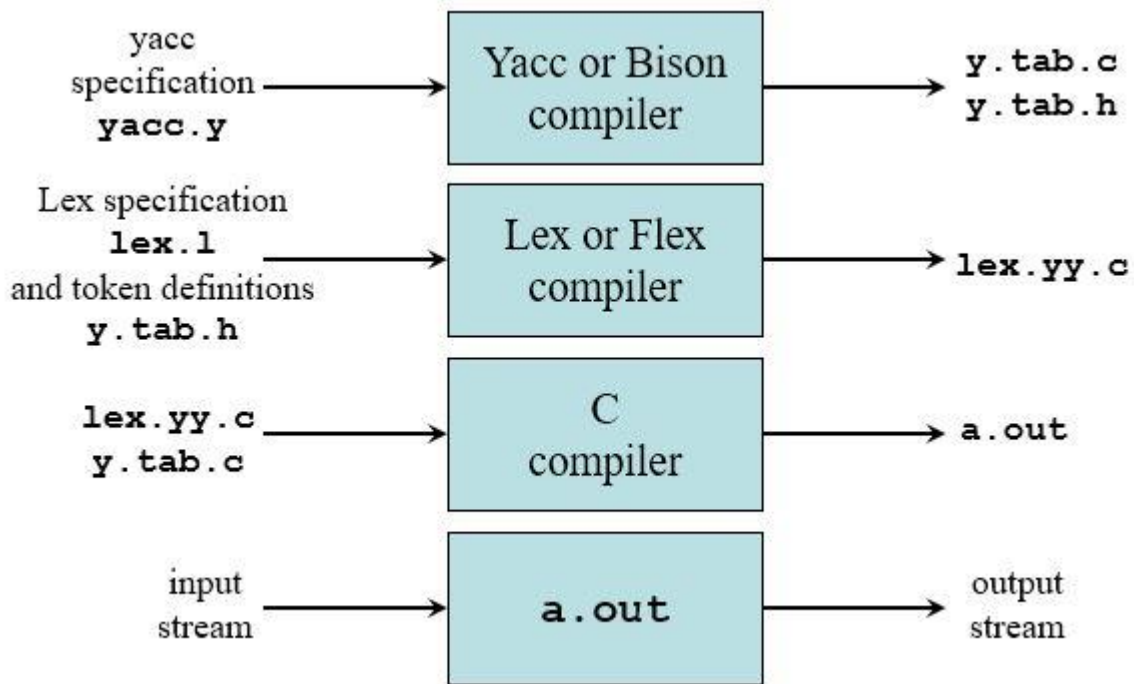

Fig. Combination with Lex and Yacc

## Chapter- 2: System Requirements Specification

Software requirements for a system are the description of what the system should do, the service or services that it provides and the constraints on its operation.

### 2.1 Hardware Requirements

Minimum hardware requirements are:

- ❖ Processors: 1.0 GHz or above
- ❖ RAM: 4GB or above
- ❖ Hard Disk: 40GB or above
- ❖ Keyboard: QWERTY keyboard
- ❖ Mouse: 2 or 3 button mice

### 2.2 Software Requirements

Minimum software requirements are:

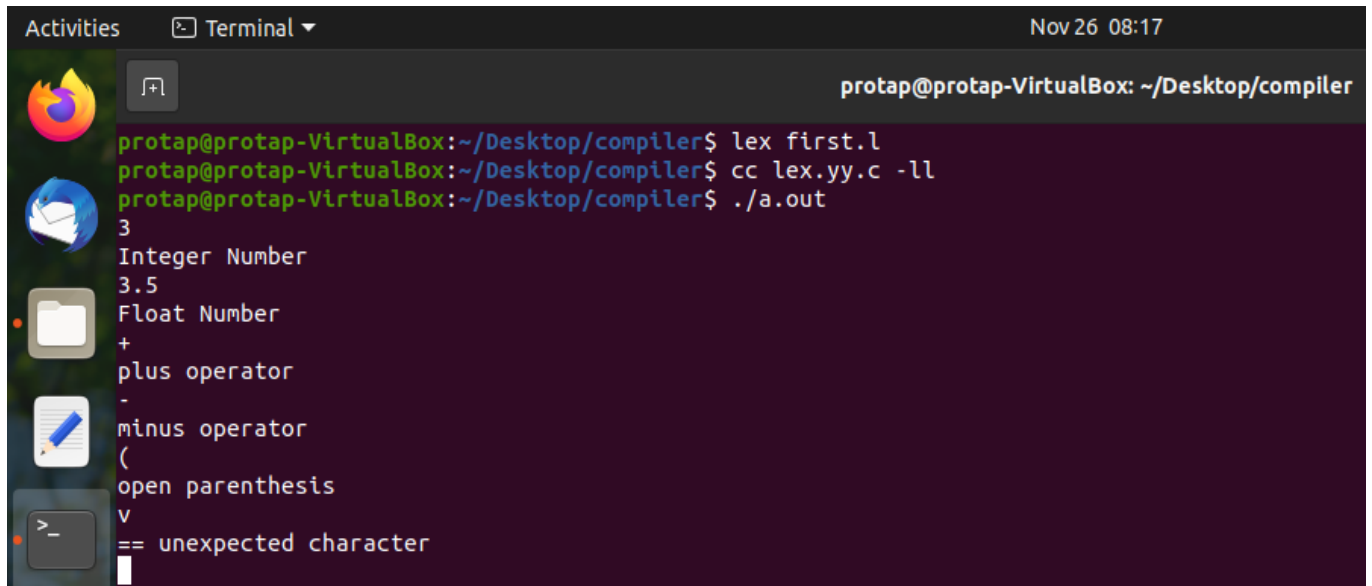

- ❖ Operating System: Linux, Ubuntu, Windows (Virtual Box) etc.
- ❖ IDE Used: VI
- ❖ Library Used: C
- ❖ Bit: X64 also run on X86
- ❖ Driver: Mouse Driver, Graphics Driver
- ❖ Compiler Language: Lex and Yacc.

## Chapter- 3: Lab Works

Lab works combines experience and innovation to provide comprehensive and tailored solutions for your LIMS needs by using the latest technologies and laboratory best practices to provide an efficient user experience (UX) that is supported by automation and real time data analytics.

### 3.1 First Program

This is the very basic and beginner level work of Lex where used VI editor.

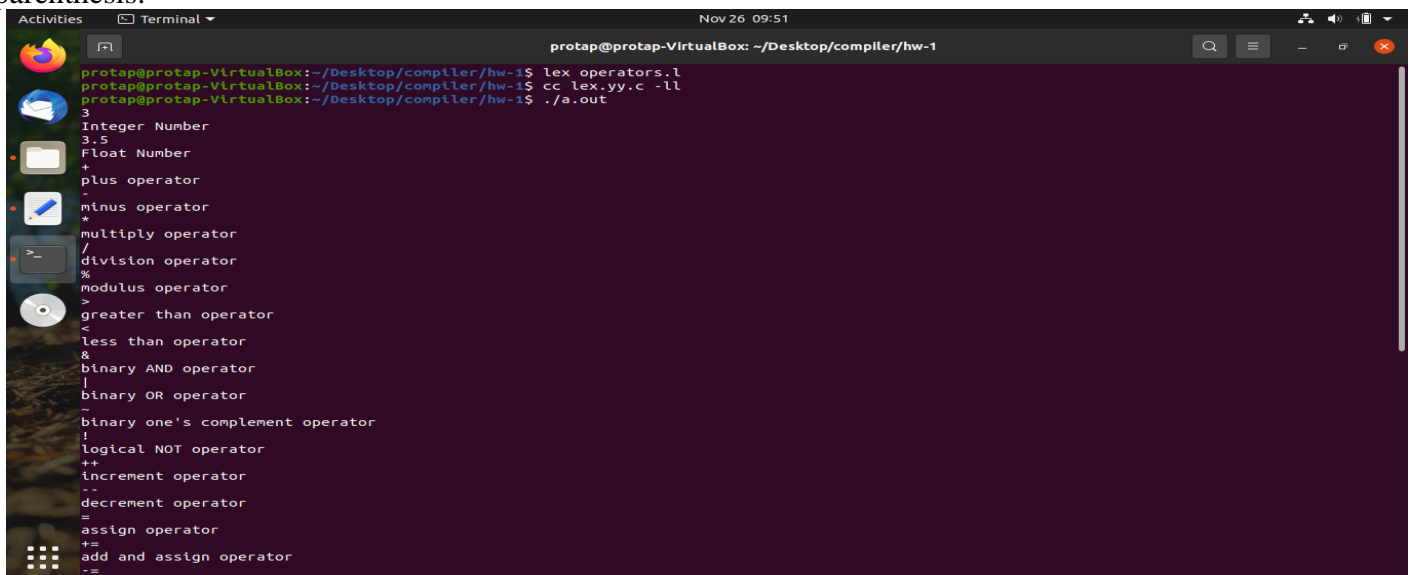

```
protap@protap-VirtualBox: ~/Desktop/compiler
protap@protap-VirtualBox:~/Desktop/compiler$ lex first.l
protap@protap-VirtualBox:~/Desktop/compiler$ cc lex.yy.c -ll
protap@protap-VirtualBox:~/Desktop/compiler$ ./a.out
3
Integer Number
3.5
Float Number
+
plus operator
-
minus operator
(
open parenthesis
^
unexpected character
```

Fig. I/O of the first program using Lex

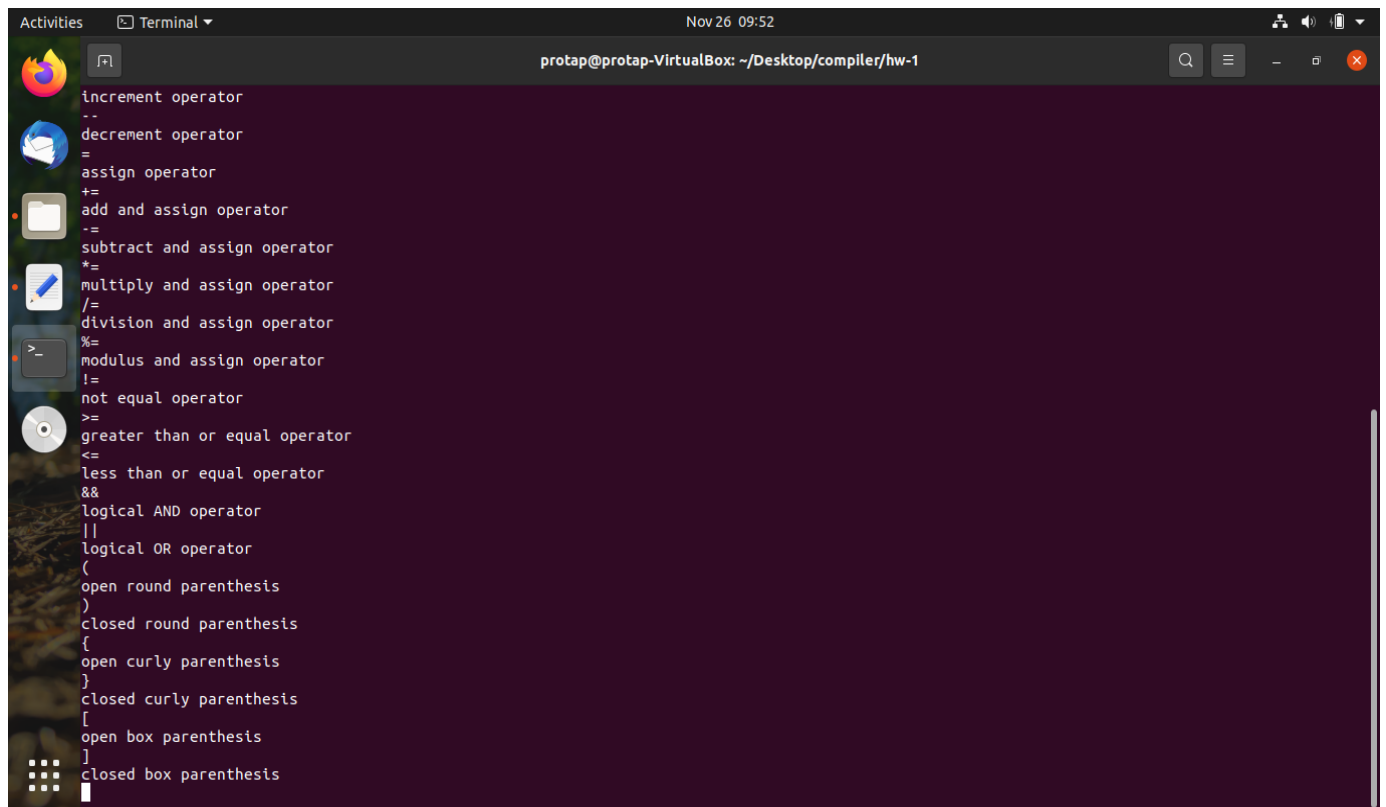

### 3.2 First Homework

This is also basic level work of Lex where used VI editor for showing almost all the operators with parenthesis.

```
protap@protap-VirtualBox: ~/Desktop/compiler/hw-1
protap@protap-VirtualBox:~/Desktop/compiler/hw-1$ lex operators.l
protap@protap-VirtualBox:~/Desktop/compiler/hw-1$ cc lex.yy.c -ll
protap@protap-VirtualBox:~/Desktop/compiler/hw-1$ ./a.out
3
Integer Number
3.5
Float Number
+
plus operator
-
minus operator
*
multiply operator
/
division operator
%
modulus operator
>
greater than operator
<
less than operator
&
binary AND operator
|
binary OR operator
~
binary one's complement operator
!
logical NOT operator
++
increment operator
--
decrement operator
=
assign operator
+=
add and assign operator
-=
subtract and assign operator
```

Fig. I/O of the first homework using Lex

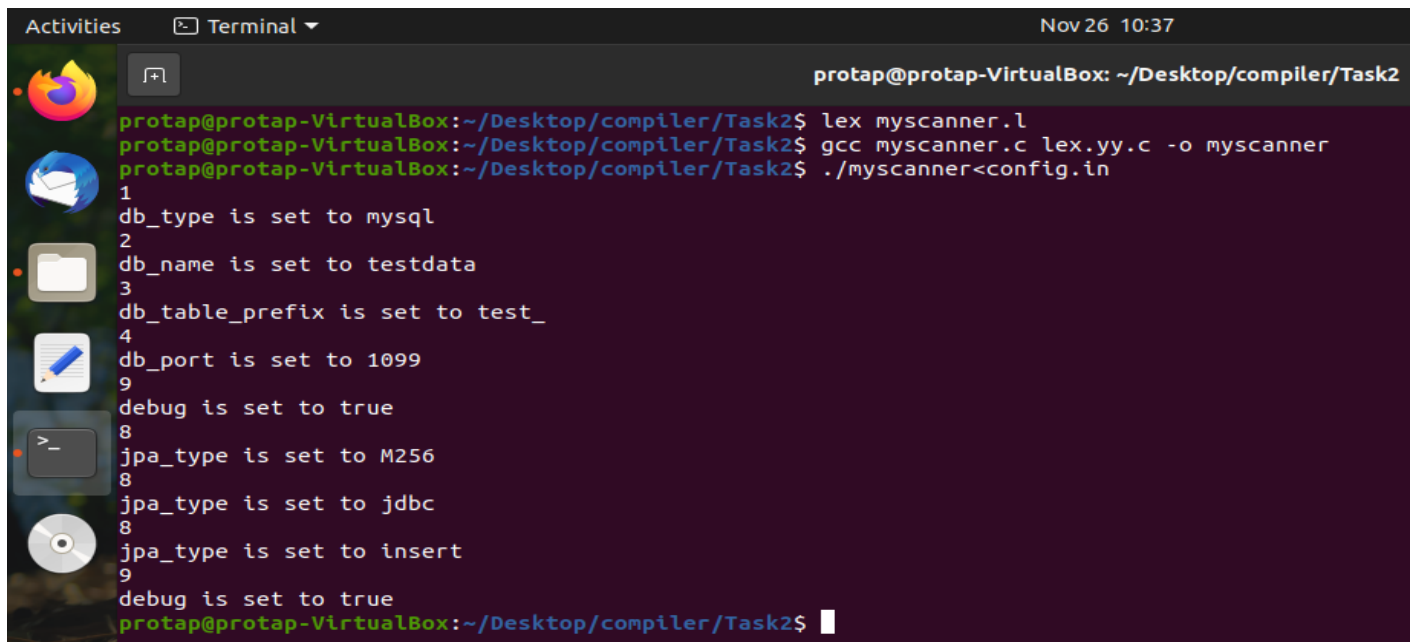

```
Activities  Terminal ▾ Nov 26 09:52
protap@protap-VirtualBox: ~/Desktop/compiler/hw-1

increment operator
--
decrement operator
=
assign operator
+=
add and assign operator
-=
subtract and assign operator
*=
multiply and assign operator
/=
division and assign operator
%=
modulus and assign operator
!=
not equal operator
>=
greater than or equal operator
<=
less than or equal operator
&&
logical AND operator
||
logical OR operator
(
open round parenthesis
)
closed round parenthesis
{
open curly parenthesis
}
closed curly parenthesis
[
open box parenthesis
]
closed box parenthesis
```

Fig. I/O of the first homework using Lex

### 3.3 Second Homework

This is somewhat advance level work of Lex where used VI editor for showing dummy data retrieving (Scanner) from the **config** file with the help of C ad its header file.

```
Activities  Terminal ▾ Nov 26 10:37
protap@protap-VirtualBox: ~/Desktop/compiler/Task2

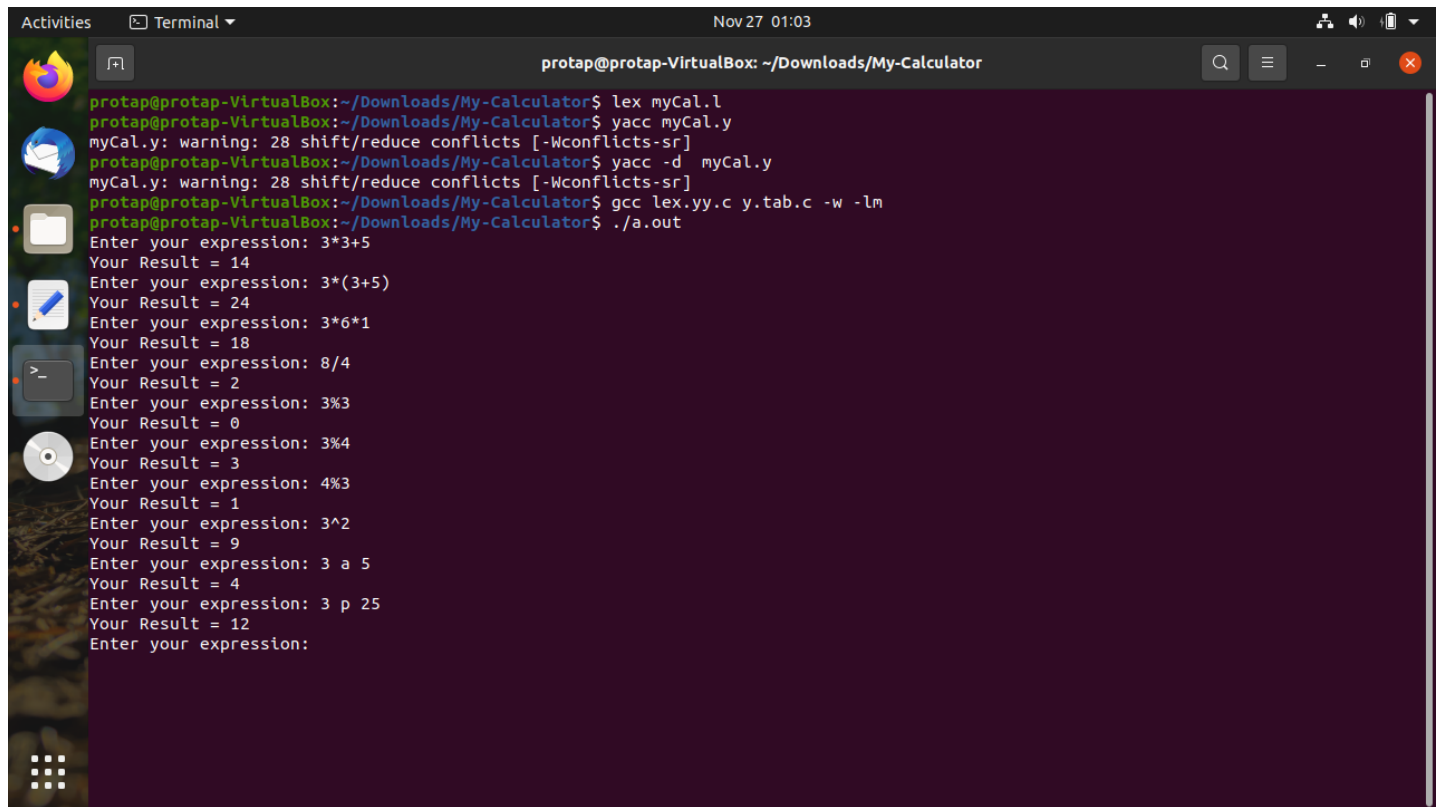

protap@protap-VirtualBox:~/Desktop/compiler/Task2$ lex myscanner.l
protap@protap-VirtualBox:~/Desktop/compiler/Task2$ gcc myscanner.c lex.yy.c -o myscanner
protap@protap-VirtualBox:~/Desktop/compiler/Task2$ ./myscanner<config.in
1
db_type is set to mysql
2
db_name is set to testdata
3
db_table_prefix is set to test_
4
db_port is set to 1099
9
debug is set to true
8
jpa_type is set to M256
8
jpa_type is set to jdbc
8
jpa_type is set to insert
9
debug is set to true
protap@protap-VirtualBox:~/Desktop/compiler/Task2$
```

Fig. Output of the second homework using Lex

### 3.4 Mini Project (My-Calculator)

It's a mini project of Lex and Yacc where used VI editor for showing some normal mathematical calculation like addition, subtraction, division, multiplication, modulus, average, percentage, etc by the help of C and Yacc header file.

```
Activities Terminal Nov 27 01:03
protap@protap-VirtualBox: ~/Downloads/My-Calculator
protap@protap-VirtualBox:~/Downloads/My-Calculator$ lex myCal.l
protap@protap-VirtualBox:~/Downloads/My-Calculator$ yacc myCal.y
myCal.y: warning: 28 shift/reduce conflicts [-Wconflicts-sr]
protap@protap-VirtualBox:~/Downloads/My-Calculator$ yacc -d myCal.y
myCal.y: warning: 28 shift/reduce conflicts [-Wconflicts-sr]
protap@protap-VirtualBox:~/Downloads/My-Calculator$ gcc lex.yy.c y.tab.c -w -lm
protap@protap-VirtualBox:~/Downloads/My-Calculator$ ./a.out
Enter your expression: 3*3+5
Your Result = 14
Enter your expression: 3*(3+5)
Your Result = 24
Enter your expression: 3*6*1
Your Result = 18
Enter your expression: 8/4
Your Result = 2
Enter your expression: 3%3
Your Result = 0

Enter your expression: 3^2
Your Result = 9
Enter your expression: 3 a 5
Your Result = 4
Enter your expression: 3 p 25
Your Result = 12
Enter your expression:
```

**Fig. I/O of the mini project using Lex and Yacc**

## Chapter- 4: Conclusion

Compiler Design and Construction is really an important course in the field of Computer Science because from its lab we learnt a lot of advance thing like Lex, Yacc, VI editor with commands, Scanner, Parser. Some basic and advanced level task also done using Lex and Yacc in this course that will help us a lot in future.
